

The State Bar of California

Data Integration Software

Request for Proposal: Questions & Responses

October 22, 2012

1. **Please provide information on the following to allow sizing: Peak transaction rate including: Source and target type (e.g. database, file, message) and average size of data transferred per transaction.**

The source file that changes the most for integration purposes is the member address change file in the DB2/400 database. Presumably it will be updating a MS SQL file. It averages between 200 to 300 changes per day up to 1500 two to three days a year with up an average of 800 changes per day for several weeks leading up to the peak days. The record length is 200 characters.

2. **“Describe how your software will handle null field data.” Question: Need a bit of an explanation here. If there is a scenario we can get it would make this much more clear.**

If one of the fields in a set of fields to be updated is null, how will your solution handle the update to the target system. Will the solution determine if translation is needed?

3. **“Describe how your tool will update data stay in sync in real time. Do you support real time data updates?” Question: What data is this pertaining to? Is it the change in the integration projects or is this pertaining to data changing within a data system such as a database?**

This pertains to data within the data system changing.
